Risk determination method		Scan	
1:10		cut off which represents a low risk.	
		After the result of the Trisomy 21 test it is expected that among 2280 women with the same data, there is one woman with a trisomy 21 pregnancy and 2279 women with not affected pregnancies. The high uE3 level is conspicuous. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value!	
Trisomy 18		Neural tube defects risk	
The calculated risk for trisomy 18 is < 1:10000, which indicates a low risk.		The corrected MoM AFP (0.89) is located in the low risk area for neural tube defects.
