Risk Trisomy 21
Tuok
1:10 The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a
low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 6044 women with the same data, there is one woman with a trisomy 21 pregnancy and 604 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measureme was done according to accepted guidelines (Prenat Diagrams). The laboratory can not be hold responsible for their impa on the risk assessment! Calculated risks have no diagnostic value! Age
Trisomy 13/18 + NT The colouisted risk for Trisomy 13/18 (with pushe)

The calculated risk for Trisomy 13/18 (with nuchal translucency) is 1:6875, which represents a low risk.
