Risks at sampling date			
Age risk at sampling date	1:619	Trisomy 21	<1:10000
Overall population risk	1:600	Trisomy 13/18	1:5161
Risk		Trisomy 21	
<p>The graph plots risk (1:10000 to 1:10) against age (13 to 49). A vertical line at age 30.2 indicates the patient's age. The calculated risk for Trisomy 21 is 1:5161, which is below the red cut-off line. The graph is divided into three zones: green (below cut off), yellow (below cut off, but above age risk), and red (above cut off).</p>		<p>The calculated risk for Trisomy 21 is below the cut off which represents a low risk. After the result of the Trisomy 21 test it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy. The free beta HCG level is low. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value!</p>	
Trisomy 13/18			
<p>The calculated risk for Trisomy 13/18 is 1:5161, which indicates a low risk.</p>
