Risk		Trisomy 21	
The graph shows age risk on the y-axis (1:10000 to 1:10) and age on the x-axis (13 to 49). A red area represents risk above the cut-off, a yellow area represents risk below the cut-off but above age risk, and a green area represents risk below the cut-off. The patient's risk is in the green area, indicating a low risk.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 1816 women with the same data, there is one woman with a trisomy 21 pregnancy and 1815 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
