

JITM Diagnostics

Patient data			
Name	MRS. JYOTI SAHNI		Patient ID
Birthday	20/11/1996		Sample ID
Age at sample date	28.5		Sample Date
Gestational age	12 + 3		
Correction factors			
Fetuses	1	IVF	no
Weight	63.5	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	no
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	0.48 mIU/ml	0.13	12 + 2
fb-hCG	110 ng/ml	2.47	Method
Risks at sampling date			CRL Robinson
Age risk	1:760		Scan date
Biochemical T21 risk	>1:50		8/05/2025
Combined trisomy 21 risk	1:59		Crown rump length in mm
Trisomy 13/18 + NT	1:335		59.1
			Nuchal translucency MoM
			0.78
			Nasal bone
			present
			Sonographer
			DR. NEERJA CHOPRA
			Qualifications in measuring NT
			M.D
Trisomy 21			
The calculated risk for Trisomy 21 (with nuchal translucency) is above the cut off, which indicates an increased risk. After the result of the Trisomy 21 test (with NT) it is expected that among 59 women with the same data, there is one woman with a trisomy 21 pregnancy and 58 women with not affected pregnancies. The PAPP-A level is low. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!			
Trisomy 13/18 + NT			
The calculated risk for Trisomy 13/18 (with nuchal translucency) is 1:335, which represents a low risk.
